BroadcastChannel('fireOAuthChannel');fireBroadcastingChannel.addEventListener('message',async(event)=>{

letdata =event.data

/**

@typedef{ Object<string,any> }Data

@property{ boolean }success-Whether thelogin wassuccessful

@property{ string }token-The data returned from the login i.e. FireToken

*/

//data.token isthe messagesent from the fireOAuthChannel after verification

//data.success is a boolean that indicates whether the verification wassuccessful

```

```

//data.token is the fire token
//What to do with the Fire Token?

// * Fire Token is a unique token which uniquely identifies the user who
authorized your login attempt with Fire
// * You can use this token ONLY ONCE as it will be destroyed after the first use

// 1. Send the fire token to the Fire Server to verify the user

// - You can do that client sided or server sided

// - You need to send a POST Request to the Fire Server with the fire token

//          at the URL: http://localhost:3003/api/tokens/verify

// - The Fire Server will verify the fire token and return a response

//          - If the verification was successful - CODE (200), the Fire
Server will return a response with the user's data

//          - If the verification was unsuccessful - CODE (400) or CODE
(401), the Fire Server will return a response with an error 'message'
// - You can use the data returned from the Fire Server to create a new user in
your database

// This example will send the token to Fire Servers and console.log the
response console.log("%c" + `Fire Token: ${data.token}`, `color: #f1c40f;
